Vember Audio releases Surge v1.2.0 update

Previously released as a VST Plug-In for 32 & 64-bit (x64) Windows, Surge is now available to Mac OS X users as well. Delivered as a Universal Binary for both the Audio Units and VST Plug-In architectures, the software synthesizer is compatible with the majority of host applications on both Intel- and PowerPC-powered Macs (1GHz G4 or faster).

Combining analog-style & wavetable oscillators, configurable dual filters with a feedback-loop and massive modulation capabilities, Surge goes far beyond the capabilities of most fixed-architecture synths but still retain the directness of one. Along with a powerful effect section and the high sound quality Vember Audio is known to deliver make Surge an obvious candidate to fulfill you synthesis and sound-design needs.

Key updates in v1.2.0:

- Improved filter algorithms. Carefully crafted to provide dependable self-oscillation at high resonance settings and a musical sound.
- Updated Graphical User Interface with a fresh new look.
- A wide selection of preset patches (914).
- Mac OS X compatible (AU & VST, Universal Binary)

Available immediately, Surge v1.2.0 can be bought in the Vember Audio on-line shop for 120€ (+VAT for EU residents). The v1.2.0 update is free for registered users.
